Technical Design Definition (TDD)	To-be created
Product Technical Documentation (PTD)	To-be created

Introduction

Talkdesk’s Conversations Mobile App lets agents take their contact-center on the road, but adoption remains low and the feature set lags behind the web application. Only 481 customers actively use the mobile app versus 2 076 on the web and adoption sits at roughly 24 % of entitled customers. Functionality currently covers about 60 % of the Conversation web app and there is a strong opportunity to capture an estimated US\$4 million in pipeline. Competing CCaaS providers such as RingCentral, Aircall, Genesys and NICE offer mobile experiences that include real-time call transcription, device switching mid-call and AI-powered call summaries. To stay competitive and better serve field agents, Talkdesk needs a modern mobile offering built on a common backend with a single cross-platform front-end.

The current State

Mobile App Gaining Momentum – Still Untapped Potential

Customer Adoption

Active Customers:

- Conversation Mobile: 481
- Conversation App: 2076

23.9% of entitled customers

Mobile: Conversations: 1: 3.6

Functionality

Agents can manage calls, view sims, customer history, update status, and get real-time notifications securely.

60% of Conversation app

Feature parity with Conversation App

Opportunity

Strong renewals, active pipeline, high growth potential.

\$4M strong opportunity sales funnel

With nearly 24% adoption and feature parity achieved, the Mobile Conversations App shows strong growth signals, especially with a \$4M sales funnel led by renewals and active mid-funnel traction.

Source: Performance Dashboard - Locker Studio, Product feature comparison, Salesforce Opportunity report

[Conversations Mobile app](#)

Executive summary

Pain

- **Fragmented codebase** – the current iOS and Android applications are separate native projects. Feature updates must be duplicated on two stacks, which slows delivery and increases maintenance effort. The web Conversations product uses a different backend from the mobile app, adding to the complexity.
- **Feature gaps** – key capabilities such as nested dispositions, call transfers to flows, call waiting, voicemail drop and visual queues are missing on mobile. Agents cannot add notes during calls or configure default caller ID settings. Competitors already offer voice-to-text transcription, call flip , AI summaries and spam-call blocking.
- **Limited adoption** – despite being positioned for field teams, only about a quarter of eligible customers are using the mobile app. Sales and customer success teams report confusion around use cases, limited marketing support and unclear differentiation versus the web app.

Jobs to be done

1. **Enable field agents to communicate anywhere** – provide inbound and outbound voice calls and SMS with core call controls (mute, hold, transfer and end) and the ability to record calls and automatically generate call summaries. Agents need to update their availability status, view recent interactions and complete after-call work from a handset.
2. **Unify the stack** – adopt the same backend services used by the web Conversations product and implement a single codebase for iOS and Android (e.g. Flutter or React Native). This reduces duplication, speeds feature parity and simplifies support.
3. **Lay the foundation for omnichannel** – design the MVP so that digital channels (email, chat, WhatsApp, social messaging) can be added without major rework. Provide clean APIs and modular UI components.
4. **Extend to additional personas** – after the agent-focused MVP, add supervisor/admin features such as user management, live dashboards and real-time coaching. Integrate emerging AI capabilities such as copilot, generative call summaries and predictive task suggestions.

Outcomes

- **Improved adoption and revenue** – by closing feature gaps and marketing to industries with mobile workforces (field services, healthcare, retail and real-estate), Talkdesk can grow mobile seats from the current ≈ 30 k to 50 k+, generating an extra US\$18 million per year.
- **Faster delivery of new features** – a unified backend and cross-platform front-end will reduce engineering overhead and allow mobile teams to achieve parity with the web application in a single quarter. New digital channels can be added once the foundation is in place.
- **Better agent experience** – agents will handle calls, SMS and after-call tasks from one app, with automatic call summaries and status management. They will spend less time on admin and more time helping customers.
- **Long-term extensibility** – the design will support future AI capabilities (copilot, contextual recommendations, AI spam blocking) and admin features without rewriting core components.

Keywords

Acronym/Phrase	Definition

Background

The mobile communications market is growing fast. The global CCaaS industry is forecast to reach US\$24.45 billion by 2032, roughly 19 % compound annual growth. Remote and hybrid working is now mainstream; surveys show more than half of employees work outside the office, and 62 % prefer flexible arrangements. Field services, healthcare, retail and real estate rely on mobile workers who need to communicate with customers without being tied to a desk. Competitors such as Genesys, RingCentral and Aircall have invested heavily in mobile experiences, offering seamless desktop-to-mobile transition, real-time transcriptions and AI enhancements.

Talkdesk currently offers a Conversations Mobile App as part of its On The Go suite. While it supports basic inbound/outbound calling and after-call work, the app has several limitations: missing call-flow transfers, nested dispositions, call waiting, voicemail drop, country code selection and number masking. There is no way to initiate SMS conversations, generate AI summaries or integrate digital channels. The

existing native iOS and Android codebases diverge from the web backend and from each other, making it expensive to maintain. Most engineering effort goes into bug fixes rather than new features.

Why is this needed?

The gap between the mobile and web products is hurting adoption and revenue. With only 23.9 % of entitled customers using the app, Talkdesk is leaving money on the table. Field technicians, outside sales reps and remote support agents need a reliable, feature-rich mobile client to operate effectively. Without investment, customers may turn to competitors that offer richer mobile experiences or revert to unmanaged personal devices, leading to data leakage and compliance issues. Unifying the backend with the web Conversations platform and adopting a single front-end codebase will accelerate delivery, lower maintenance costs and enable new channels.

PDD checklist

As the PDD is written, mark items where the draft and final versions have been completed. Once all items are complete, the PDD STATUS should be updated to READY.

User stories

User stories should follow the format:

As a [persona] I want [goal] so that [reason].

The description column can be used if more explanation of the requirement is needed.

MoSCoW represents the acceptance of the user story and will be one of the following values:

MUST HAVE COULD HAVE SHOULD HAVE WON'T HAVE

USER STORY	DESCRIPTION	MoSCoW
As an agent I want to make and receive voice calls from my smartphone so that I can support customers when I am away from my desk.	Core calling functionality with mute, hold, transfer and end call controls.	MUST HAVE
As an agent I want to send and receive SMS messages through my business number so that I can quickly respond to customer enquiries via text.	Uses the same number as the web app, supports inbound/outbound SMS and logs interactions in CRM.	MUST HAVE
As an agent I want to record calls and receive automatic call summaries so that I can focus on the conversation while	Records voice conversations, uploads them to the backend and generates AI-powered summaries for after-call work.	SHOULD HAVE

ensuring accurate notes.		
As an agent I want to view recent calls, texts and customer context so that I can quickly recall previous interactions on the go.	Mobile activity feed displays recent interactions and links to CRM data.	SHOULD HAVE
As an agent I want to update my availability status (available, away, offline) from my phone so that colleagues know when I can accept interactions.	Status changes sync with the desktop and routing engine.	MUST HAVE
As an agent I want to switch between devices during a call (e.g. move from mobile to desktop) so that I can continue conversations without dropping the call.	Requires seamless call handoff between devices.	COULD HAVE
As an admin I want to view agent performance and configure settings from the mobile app so that I can manage the team while out of the office.	Dashboard, user management and notification configuration.	Phase 2
As an agent I want to switch between devices during a call (e.g. move from mobile to desktop) so that I can continue conversations without dropping the call.	Requires seamless call handoff between devices.	Phase 2

Customer journeys

Agent handling a support call while on a site visit

1. **Receive call notification** – The agent receives a push notification for an inbound customer call. She taps to answer, and the mobile app shows caller details from the CRM.
2. **Conduct the call** – During the conversation, she can mute, hold or transfer the call. She can consult a colleague via conference or blind transfer if needed. The app records the call.
3. **After-call work** – Once the call ends, a wrap-up screen appears. The agent enters a disposition and optional notes or relies on the AI-generated summary. She sends a follow-up SMS to confirm next steps.

4. **Review and status update** – The call, recording and summary automatically sync to the backend. The agent reviews recent interactions and sets her status to “Away” while travelling to the next site.

Agent initiating an SMS conversation with a customer

1. **Open contacts** – From the mobile activity feed the agent selects a recent caller or searches for a contact.
2. **Send text** – She composes an SMS using her business number. The message appears in the customer's native messaging app. Replies trigger push notifications.
3. **Escalate to voice** – If the text conversation requires a call, she taps a call button within the thread to initiate a voice interaction.

These journeys demonstrate how agents can manage customer interactions end-to-end from a mobile device without returning to a desktop.

Additional product notes

- **Shared backend** – The mobile app will consume the same call, messaging and CRM services used by the Conversation web product. Existing REST/GraphQL endpoints will be reused wherever possible. Any mobile-specific endpoints (e.g. push token registration) will reside in a dedicated gateway but share the same domain logic.
- **Cross-platform front-end** – Evaluate React Native and Flutter for the MVP. React Native aligns with the existing web React stack and may accelerate reuse of UI components. Flutter offers strong performance and a single rendering engine. A technical spike will compare developer productivity, performance and accessibility support before choosing.
- **Offline support** – For industries with poor connectivity (field services), the app will cache recent interactions and allow wrap-up entries to be queued and synced once connectivity returns.
- **Accessibility** – The design must comply with WCAG 2.1 AA standards. Use system fonts, high-contrast colour palettes and large touch targets.

Integration roadmap – After the MVP, integrate digital channels (email, chat, WhatsApp) via the existing omnichannel platform. Future releases will also integrate with Live CRM (e.g. Salesforce, Zendesk) and support call-flip and AI copilot features.

Competitive analysis

Feature parity across mobile contact-center providers

Feature	Talkdesk Conversations Mobile	Five9 Mobile	RingCentral MVP mobile	Genesys Cloud mobile	Aircall Mobile	NICE CXOne Mobile
Inbound & outbound calls	Yes	Limited	Yes	Yes	Yes	Yes
Call controls (mute, hold, transfer)	Yes	Not specified	Yes	Yes	Yes	Yes
Call recording	Yes	Not specified	Yes	Yes	Yes	Yes
After-call work (dispositions, notes)	Yes	Not specified	Yes	Yes	Yes	Yes

Status management (availability)	Yes	Not specified	Yes	Yes	Yes	Yes
CRM integration	Yes	Yes	Yes	Yes	Yes	Yes
Hands-free shortcuts	Yes (Siri support)	Not specified	Yes	Not specified	Not specified	Not specified
Single sign-on (SSO)	Yes	Not specified	Yes	Yes	Yes	Not specified
Reporting & analytics	Yes	Yes	Yes	Yes	Not specified	Yes
Device support	iOS, Android, smartwatch	Not specified	iOS, Android	iOS, Android	iOS, Android	Not specified

Additional features offered by competitors (not currently in Talkdesk)

Feature	Competitor(s)	Description
Real-time call transcription	RingCentral, Aircall	AI transcribes calls live for better follow-up and documentation
Call flip (switch devices mid-call)	RingCentral	Allows users to move a call from mobile to desktop or vice-versa without dropping the call
Mobile heads-up display (HUD)	RingCentral	Shows colleague availability and lets agents manage call flows easily
AI-powered call summaries	Aircall	Automatically generates summaries highlighting key points, saving agents time
Message forwarding/post sharing	RingCentral	Share content from one conversation into another
Mobile room control	RingCentral	Manage meeting room settings via mobile

AI spam call blocking	RingCentral	Filters unwanted calls using AI
Visual IVR & forms	Five9	Turns traditional IVR into interactive mobile menus
Visual customer satisfaction surveys	Five9	Collects feedback visually post-call
Shared contact & inbox	Aircall	Enables team-based call tracking and shared customer history
AI call analysis (talk-to-listen ratio)	Aircall	Breaks down conversation dynamics for coaching and insights

The analysis shows that Talkdesk already covers core call handling, call recording and SSO but lacks AI-driven features and seamless device switching. These gaps inform the future roadmap (phases beyond the MVP).

Feasibility study - Tech Advisor / Engineering Manager

Architecture overview

- **Backend** – The mobile app will connect to the existing Conversation voice microservices. Voice calls will be handled via the same SIP proxy, call router and media servers used by the web client. SMS will utilise the existing programmable SMS service. A new mobile gateway will manage authentication, push token registration and device metadata. The backend will expose GraphQL endpoints for voice, SMS and CRM data to simplify integration with the cross-platform front-end.
- **Front-end** – A cross-platform framework (React Native or Flutter) will deliver a single codebase compiled to native binaries. Shared UI components (dialpad, contact list, message thread, call controls) will be built as modular packages. Platform-specific features such as push notifications, background services and audio routing will be abstracted behind interfaces. The mobile app will integrate with native contact lists to display colleagues and business contacts.
- **Security and compliance** – Authentication will rely on Talkdesk SSO (OAuth 2.0) with token refresh. All signalling and media traffic will be encrypted (TLS/SRTP). Call recordings and SMS transcripts will be stored in the same compliant storage as the web client. The app will implement device-level biometrics (Face ID/Touch ID) for secure access.

Technical concerns and mitigation

- **Real-time performance** – Cross-platform frameworks may introduce latency. A prototype will benchmark call quality, CPU usage and memory footprint on mid-range devices. Performance-critical modules (e.g. media handling) can be written in native code and bridged into the framework if needed.
- **Push notification reliability** – Use Firebase Cloud Messaging (Android) and Apple Push Notification Service (APNS) with fall-back to VoIP notifications. Implement exponential backoff and background message queueing for offline scenarios.
- **Integration with existing services** – The voice backend will need minor adaptations to support mobile device registration and to unify endpoints for SMS. API versioning ensures backward compatibility for the web app.
- **Choice of framework** – A spike will compare React Native (alignment with web React components) versus Flutter (performance and UI consistency). The decision will be based on developer productivity, community support and long-term maintainability.

Feasibility study - Design

Design principles

- **Consistency** – Align with the Talkdesk design system used on the web. Buttons, typography and colour palettes will remain familiar to agents switching between desktop and mobile.

- **Simplicity** – Mobile agents often work under time pressure. The dialpad, message threads and call controls must be accessible with a single tap. Post-call wrap-up should ask only for essential information and automatically include AI-generated summaries.
- **Contextuality** – Show relevant customer information at the right moment (e.g. recent tickets or CRM notes when answering a call). Let agents toggle between call controls and CRM context without losing the call screen.
- **Accessibility** – Use large touch targets and text sizes, support dark mode and respect platform accessibility settings. Provide voice-over labels and haptic feedback.

Low-fidelity plan

1. **Home screen/activity feed** – a scrollable list of recent calls and SMS conversations with search and filters. Each item shows caller/contact name, type (call or SMS) and timestamp. Tapping opens the conversation thread or call details.
2. **Dialer/message composer** – a numeric keypad with country code selector, quick actions for favourite contacts and a text box for composing SMS. A plus button opens the address book. The dialer also allows paste-to-call.
3. **Call screen** – minimal interface showing caller name, timer and call controls (mute, hold, keypad, transfer, add participant, record). Swipe gestures toggle between call controls and CRM context. A red end-call button is prominent at the bottom.
4. **Wrap-up screen** – after a call, agents select a disposition from a drop-down and optionally type notes. An AI summary is displayed for review and editing. There is a timer to encourage timely wrap-up.
5. **Settings/profile** – agents manage their availability status, notification preferences, voicemail greeting and accessibility options. Admin users (in later phases) will have additional menus.

These wireframes will be refined in collaboration with the design team and validated with user testing sessions.

Assumptions, risks, limitations and dependencies

Assumptions

- The existing Conversation backend services can support mobile usage at scale without significant refactoring.
- A cross-platform framework will provide sufficiently native performance for voice calls and messaging.
- Agents will adopt the new app if feature parity with the web product is achieved and the experience is intuitive.
- AI summarisation will be available via existing Talkdesk AI services or integrated third-party APIs.

Risks

- **Performance and latency** – if cross-platform performance is inadequate, the user experience may degrade. Mitigation: prototype and optimise native modules where necessary.
- **Security and compliance** – storing call recordings and SMS transcripts on devices can pose data privacy risks. Mitigation: encrypt data at rest, require biometric authentication and allow admins to enforce mobile device management policies (remote wipe, minimum OS version).
- **Change management** – agents and administrators may resist migrating from the existing mobile app. Mitigation: provide training, clear documentation and parallel run until parity is proven.
- **Dependency delays** – reliance on the voice backend team, AI services and digital channel teams may affect timelines. Mitigation: align roadmaps early and identify blockers.

Limitations

- The MVP will focus only on the agent persona; admin capabilities and supervisor dashboards will be delivered in later phases.
- Digital channels (email, WhatsApp, chat) will not be available at launch but are planned for parity with the web product in subsequent releases.
- Advanced AI features such as call transcription and spam filtering are outside the initial scope; these will be added based on market feedback and technical feasibility.

Dependencies

This will include known dependencies on other Talkdesk teams or third-parties including partners and customers.

Dependency	Responsible party	JIRA/support information
Conversation voice backend services	Voice platform team	Updates needed to expose unified voice/SMS endpoints and support device registration
SMS service integration	Messaging platform team	Configuration to allow mobile origin and deliver inbound/outbound SMS through the same number
Push notification infrastructure	Infrastructure team	Set up Firebase/APNS keys and ensure high availability
AI summarisation service	AI/ML team	Provide API for generating call summaries and support language coverage
Digital channel integration	Omnichannel team	Future dependency for email, chat, WhatsApp support

Data privacy and compliance

This section should include any known InfoSec or Data Privacy requirements. Where necessary, InfoSec and/or Legal should be engaged to understand any impacts in those areas.

AREA	IMPACT?	DESCRIPTION OF IMPACT	MITIGATION/REQUIREMENTS
InfoSec / Data Privacy	☒ Yes ☐ No	Call recordings and SMS transcripts may contain personally identifiable information (PII). The app will store tokens, cached data and call recordings on the device.	Encrypt data at rest using device-level encryption. Require biometric or PIN authentication on launch. Allow admins to enforce mobile device management policies (remote wipe, minimum OS version).
Legal	☒ Yes ☐ No	Different countries have specific consent requirements for call recording and SMS marketing.	Include configurable consent prompts and respect “do not record” flags. Provide regional settings for opt-in/out and ensure all marketing SMS are sent via compliant workflows.
Does this feature require Talkdesk to	☐ Yes ☐ No ☒ May be	Certain industries may require (healthcare, finance) specific certifications (HIPAA, PCI).	Ensure the mobile app inherits the same compliance certifications as the web Conversations platform. Engage

attain
certification?

InfoSec and compliance teams
early in the design.

GTM readiness summary

The following sections describe the non-engineering work required to wrap-around new products and features to support the [Talkdesk GTM process](#). Product Manager will review and identify the items required for a given feature. Depending on the size of the new capability many of these may be required or very few.

Definitions for the different phases of the Customer Experience Journey are outlined below.

▼ Definitions

CX Stage	Description
Explore	“Consideration” Phase: PDD includes items that should be made visible to customers when they are exploring possible vendors/solutions. • If yes, example GTM items that would be impacted: • If no, skip
Offer	“Intent/Evaluation” Phase: PDD includes items that will effect how a customer is offered/quoted/priced. • If yes, example items that could be impacted: Salesforce - in particular SKUs, Pricing, Billing, Terms and Conditions, alignment to what was presented during Explore • If no, skip
Buy/Setup	“Purchase” Phase: PDD includes items that will effect customer onboarding or provisioning. Examples would be features that result in additional work for PS, Engineering on a per-customer basis, additional work on PAS to automatically provision, additional work by the customer to set it up. • If yes, high-level list of items that will be impacted - e.g. Engineering “Method of Procedure/Runbook”, SKU Catalogue Mapping, Provisioning process, KB articles to help customer self-serve, etc • If no, skip
In-Life / Get Help	PDD effects how the customer is supported in-life or how they will get-help. For example has a material change occurred that requires Support to onboard/learn, is anything new required in the support tool (e.g. Zendesk), new docs/training required for CSMs/TAs or documentation for customers directly to know how to use the new feature? • If yes, high-level list of items that will be impacted. TDU, TD Academy, KB, Webinars, Website, Videos, Conversations etc, refer to Product Ops. GTM List • If no, skip
